BME healthreach[©]

AN EDUCATIONAL ENRICHMENT PROGRAM IN COLLABORATION WITH
GEORGIA TECH, EMORY UNIVERSITY, AND CHILDREN'S HEALTHCARE OF ATLANTA

- Interactive science and math educational enrichment outreach program focused on chronically ill hospitalized children
- **Child's own disease is used as the springboard and hook for learning**
- Goal of motivating and sparking an interest in science and math.
- Designed to **augment** classroom teaching and provide educational experiences with interactive hands-on activities

Idea

- Could we turn BME HealthReach into a digital gaming platform?
- Chronic illness and human physiology situates STEM learning in a personally meaningful context.

HEMONAUTS
is a transmedia
educational platform
created by

in collaboration with
researchers and
clinicians from

 **EMORY**
UNIVERSITY

**Georgia
Tech**

Children's
Healthcare of Atlanta

Seed Funding Provided by

NIH
National Institutes
of Health
SBIR/STTR

Increase Disease Literacy

Players learn about disease physiology, treatment compliance, and healthy lifestyle choices through engaging gameplay.

Reinforce STEM Concepts

Integration of standards-based math and science content allows players to continue learning even when they have to miss school.

Discover STEM careers

Roboticians, scientists, engineers, and doctors provide missions and positive remediation when needed.

Engineer. Play. Win.

Players collect and customize nanobots to complete missions within the human body. Repeat and level-up to unlock features after demonstrating concept mastery.

Population - Sickle Cell Disease

Game testers

- 10 - 13 year olds, in 5th - 7th grade
- Sickle cell disease anemia patient
 - Suffers from acute and chronic pain
- Misses school on average 1 day a week

Concerns

- Missed school, falling behind in STEM areas
- Unable to talk about their disease with classmates or friends
- Transition into adulthood will also mean more responsibility for medical care

Game Goals

- Created a suite of games with Thrust Interactive
- Research questions: Can gameplay lead to:
 - Increase STEM content knowledge?
 - Increase knowledge of and intent to persist in STEM careers?
 - Increase disease literacy to improve patient self-advocacy, treatment compliance, promote healthy lifestyle choices?

Mini Game – Cell Counter

- Navigate a nanobot through the veins to count red blood cells.

Cell Counter Feedback

- Described as a game focused on “counting” or “scanning” blood
- Game moved too fast
- Had to restart the game to understand how to play
- STEM content missed primarily because it was integrated into the directions.
- Unable to make the connection between counting the number of cells repeatedly for the purpose of finding an average.

Mini Game – Cell Navigator

Cell Navigator Feedback

- Enjoyed the side-scroller game action
- For Sickle Cell Disease – hydration used to prevent pain crisis
- Confused about the effects of beverage choices – water vs. milk
- Unable to grasp how the games was contextualized in the body

Mini Game – Body Balance

Body Balance Feedback

- Most popular game
- Players felt they learned something about balancing food and beverage intake and exercise/exertion
- Most successful at delivering health education
- **“Don’t overdo it. Drink more water. And calories you burn, try maintain it. Like keep it balanced... Don’t get dehydrated...”**

Overall Results

- Games were successful at delivering health education
- Patient's thought the game was set in their body
- Limited success in communication higher-level STEM content
- **“Games were fun, intuitive, and easy to manipulate toward an understood goal.”**
- Expressed feelings of loneliness and embarrassment, unable to explain their disease.
- Patients showed a strong interest in learning about sickle cell disease and their bodies but,
- Demonstrated a large deficit in knowledge of disease physiology and management

Next Steps

- Received NIH SBIR Phase 2 funding August 2018
- Revising the games with goals:
 - Increase STEM content knowledge through gameplay
 - Increase knowledge of and intent to persist in STEM careers
 - Increase disease literacy to improve patient self-advocacy, treatment compliance, and to promote healthy lifestyle choices
- Include supplemental, mixed media remedial education materials.
- Assessment
- Answer our research question:
 - What is the optimal mode of delivery for STEM educational content within mixed media to promote increases in content knowledge and intent to persist in STEM?

Questions

- Funded by the National Institutes of Health Small Business Innovation Research – Serious STEM Games for Pre-College and Informal Science Education Audiences
