

Smart and Robotic Homes:

SmartBathroom: Developing an Environment to Study/Facilitate Bathroom Transfers

Presenter: Brian D Jones

Current Project Team: Jon A. Sanford (Co-PI), Tyler Labean, Su Jin Lee,
Prasanna Natarajan, Peter Presti, Russell Taylor

Rehabilitation Engineering Research Center on
Technologies to Support Successful Aging with Disability

The Aware Home

Research Areas

Health and Well-being

Empowering: Independence; Health self-management; In-home rehab; Wellness; Social connectedness

Connected Home Experience

Simplifying smarthome setup & management; Data/behavior-driven home control; Whole home gaming; Sustainability (resource management)

Assessing Function to Inform Adaptive Supports in the Home

Hypothesis:

In-situ assessment of individual function can contribute to identification of daily and longitudinal trends that will allow automated adaptation of the environment to support greater independence of the individual.

In-situ Functional Assessment

Aware Home Floorplan

In-situ Functional Assessment

Kinect for Gait Speed Analysis

Proof of Concept Gait Speed Measurement Device

SmartBathroom

• A lab designed to study transfer performance in a home bathroom environment

Purpose

Integrate Physical and Digital Worlds:

Develop a bathroom environment with embedded sensors capable of assessing an individual's abilities at any point in time and automatically adjusting supportive environmental features to accommodate those abilities.

Goal:

Explore task performance during toilet, shower and bath transfer of older adults (60+), who can ambulate with or without a caregiver, but who have physical upper or lower-body impairment

Prior Research: Demonstration of Transfers

Prior Research: Demonstration of Toilet Transfers

SmartToilet Development

SmartToilet Features

Sensing Capabilities

- **SmartFloor** – detect foot location and weight shift
- **SmartGrabbar** – measure grip location, strength, weight and direction of forces during transfer
- **SmartToiletSeat** – detect weight and during transfer and weight-shift while seated.

SmartToilet Features

Adjustable Features

- **Toilet**
 - Height (motorized)
 - Horizontal position
- **Bi-lateral toilet grabbars**
 - Height relative to toilet seat
 - Horizontal distance relative to toilet center line

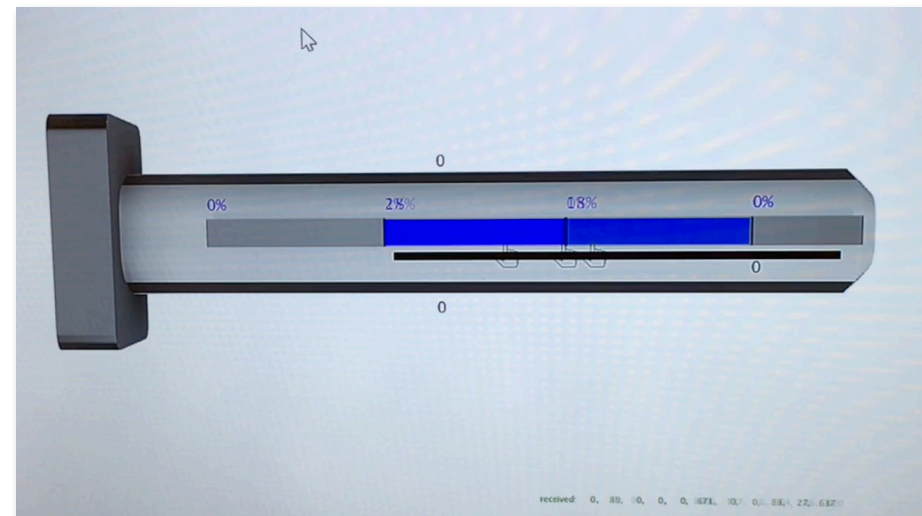

SmartFloor

- Floor sits on top of load cells
 - Detect location and vertical forces

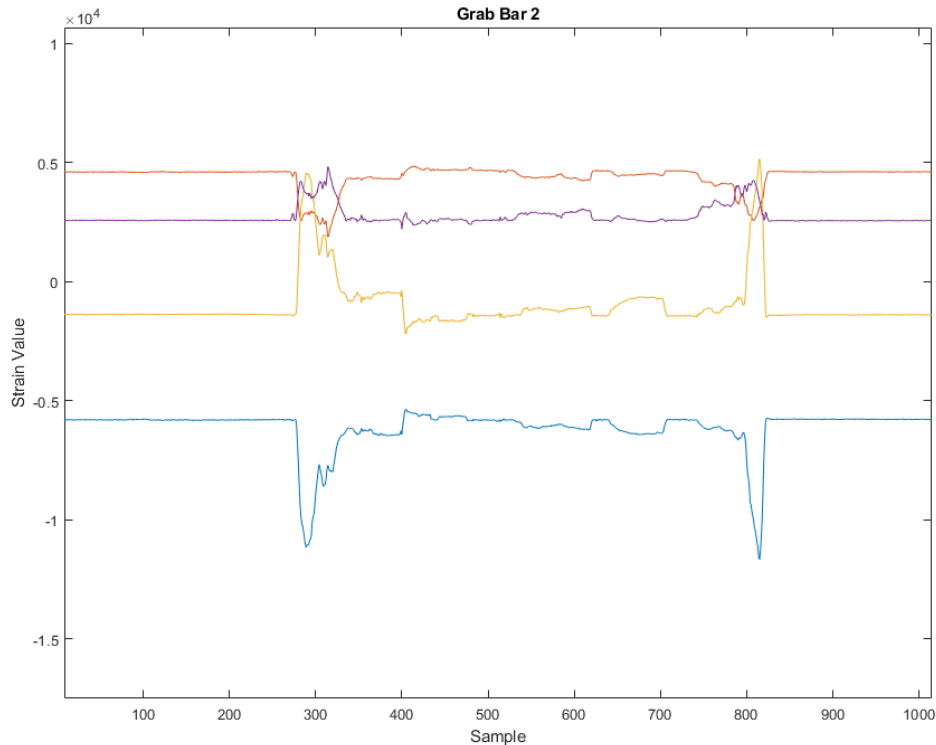

SmartGrabbar: Grip

- Force/location sensors on top of bars
 - number of hands
 - position of hands
 - relative grip strength
- Force sensors on sides and bottom
 - type of grip
 - relative grip strength

SmartGrabbar: Support Forces

Load cells support grab bars
– Provide precise force / direction

SmartGrabbar: Support Forces

Load cells support toilet seat

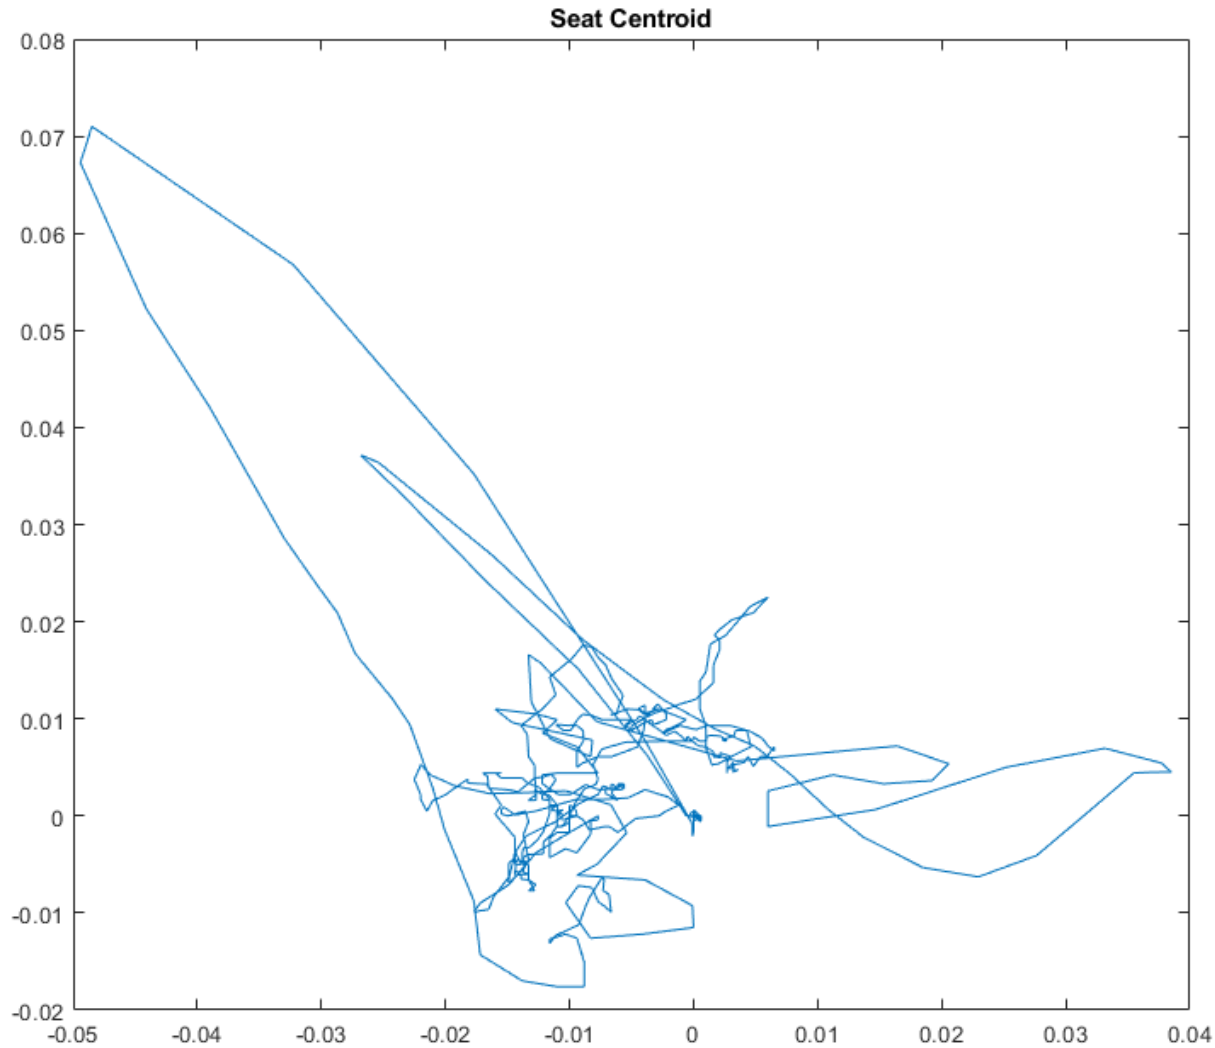

- Forces during transfer
- Weight shift while seated

SmartSeat

SmartGrabbar: Support Forces

Future Plans

Study Plans

- Monthly Visits / trials with target participants to build a dataset of function over time.
- Identify data (devices) most useful for identifying changes in function and where supports might improve performance
- Explore patterns in dataset of individuals and across individuals as related to

Expansion

- Develop SmartBathing Testbed
- Long-term: Automate aspects of the bathroom to facilitate personalized transfer

Thank you
